**GSR Presents
a new press
the 20/980**

In foothills of the Italian Alps, GSR Cocoa Machinery announced the latest addition to its engineering excellence—the Series 980 Cocoa press. The machine boasts 980 kg/cmq

of sheer Italian power. Kennedy's researchers worked out that it's almost four times as much as a bite of an alligator—the most powerful pressing force in the animal kingdom.

With over 30 years of experience, GSR has perfected a cocoa press with an impressive production capacity increased by 9-10% aiming to satisfy new trends in the food processing sector, including safety and quality.

Engineers at GSR ensure that ordinary maintenance operations can be completed quickly and with ease; as well as reducing costs, this helps producers to overcome obstacles like production inefficiencies. Of course, the machine is modern in terms of its energy consumption, the R&D department of GSR Cocoa Machinery said that "reduction in the overall energy consumption, together with the decrease in the duration of the pressing cycle, leads to a reduction in the total cost per ton of process: a valuable result in order to obtain a perfect production process."

GSR makes an effort to offer flexibility, an added value that permits the company to guarantee its consumers a competitive advantage, allowing them to have ad hoc designed pressing lines, like a tailored suit. Luigi Turla, CEO and founder of the company explains: "For us, merging mechanical concepts with the awareness of what customers are looking for today is the best strategy to work at the highest levels."
